

This is a JPEG file CONVERTED to EPS

This is a vectorized EPS file

If you take a JPEG file or a multi-color TIFF file and convert it to a EPS file it DOES NOT vectorize the artwork. It just changes the file format and it is now a EPS file that RETAINS all the unusable qualities of the original JPEG or multi-color TIFF file.

A vectorized file is created with a computer program such as Adobe Illustrator.

This is a vector based art program.

The vectorized eps file is the best format for the customer, in that it speeds up production time. If we have to recreate a JPEG file, depending on the complexity of the artwork, it can take anywhere between 5 and 8 hours, that will be billable by the hour as extra art time charges.

By being vectorized we can do color separations much easier and quicker ensuring that your final product will look as clean and sharp as possible.

THESE ARE THE BEST FILES TO SUBMIT TO THE ART DEPARTMENT

ELECTRONIC ART

- Illustrator vectorized EPS files
- 1 color High Resolution TIFF file (300 dpi)

We are Macintosh based, when submitting art please include any fonts (typefaces) that you may have used or convert the fonts into outlines (art).

Art can be sent to us electronically via e-mail, or put on a CD, Zip Disk or a Floppy Disk. Please do not compress or stuff the files as we have found that many times the files become corrupt and we cannot open them.

Please include in any Pantone (PMS) numbers that were used in the art.

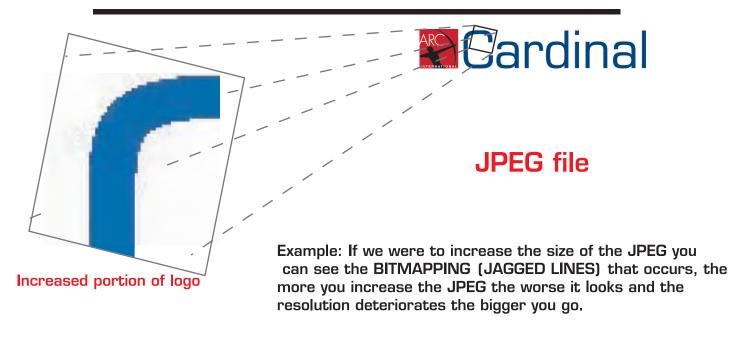

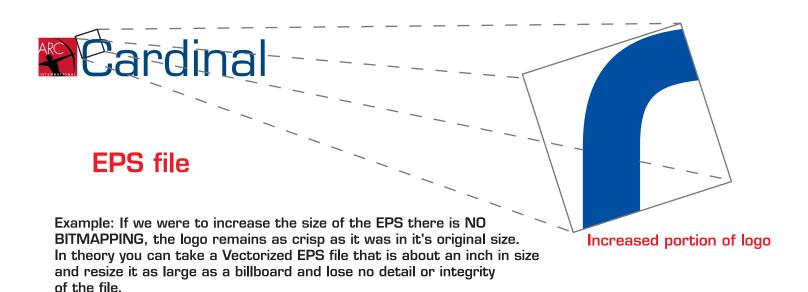

This is a JPEG file

This is a vectorized EPS file

At first glance both files look the same, even though they both get their point across there are many differences. A JPEG file is usually a low resolution image which is mostly used in web pages. It cannot be manipulated to meet our printing needs. On the other hand a vectorized EPS file can be manipulated in any shape or form to turn out higher quality for your decorated glassware. See the examples below.

Fonts

When suppling us with art please include the font files used or convert the fonts into outlines (or Curves). If we do not have the correct font files the computer will try to compensate for the missing font with one that it deems suitable, more times than not it will choose a font that does not resemble yours, the spacing and placement of the letters may also become distorted as the examples below show.

Original Art
with correct
font

Original Art
without correct
font

The fancier the font, for example, if it contains fine serifs or swirls, the more of a chance that it might not print well, especially if it is printing in a very small area.

Example

This text would be diffucult to reproduce at this size

Due to FDA regulations,

we cannot print

above 20 mm from the lip of
the glass

The print area is as follows:

As far as the height is concerned the max we can print is 3 3/4 " in height.

As far as width is concerned we can print a full wrap around the glass, the maximum width being 9.09 ",leaving a 1/4" gap between the art.

G3960 16 oz. Mixer Glass specifications for item G3960 16 oz. Mixing Glass

We are Macintosh based and accept artwork in the following format: Vectorized EPS file.

Please include all fonts with the art file or convert them into outlines. Please include all PMS numbers for your colors.

Our glasses are screen printed using spot colors. We can currently print anywhere between 1 and 5 colors.

When a Full Wrap is printed the art does not "touch" or "meet", instead there is a1/4" gap in between the art.

EXAMPLE EXAMPLE

3.3" IN WIDTH

Please keep in mind that if you are printing a square logo, or printing close to the bottom of the glass tapering will take place due to the taper in the glass.

If your logo is NOT a full wrap, but is 1 or 2 sided, In order for your logo to remain legible it should not exceed 3.3" in width.

PMS Colors

When choosing what colors to print please try to provide us with a PMS (Pantone Matching System) number. Sometimes a customer will tell us to "just print RED". If you look at the chart you will notice that there are many different "REDS" you can choose from and this is only a small sampling.

The chart is an example of a page from a PMS book. In a PMS book all colors are assigned a number. You can purchase a PMS book from any art supply store or visit the following web page http://www.pantone.com for more information.

Keep in mind that if you visit the web page the colors you see on your screen will vary from what is actually printed since colors vary from monitors versus what is printed on paper versus our ceramic paints.

Process vs.Spot

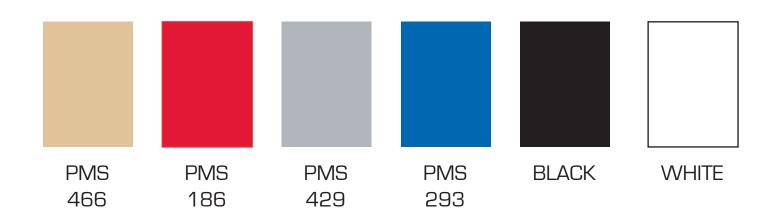

Vectorized Spot color

Enlarged to show details

The above image was printed using Spot color printing. In order to achieve the colors needed in the individual file we had to pick solid PMS colors, as the files below show. Our inks are Ceramic based and do not mix or blend to create other colors as Process inks do. We also need to print White, whereas printing process on White paper essentially makes the White a "free" color, this is one advantage printing on glass that we do not have.

Process vs.Spot

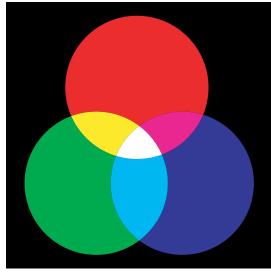

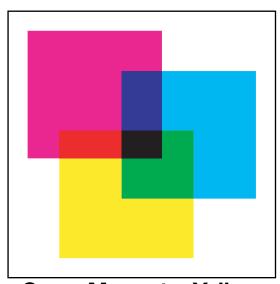

Enlarged to show "dots"

The above image was printed using 4 color process printing. If you take a look at the image below it shows how process inks are used to combine basic colors to create new colors. If you take a closer look at the enlarged areas you can see where the colors have overlapped and created new colors. We Do NOT print four color process.
